AutoLISP AutoLISP is a programming language that allows users to create macros, scripts and functions that can be stored within the application and reused across multiple drawings. AutoLISP was originally released as a project called InstantCAD, and it was later named AutoLISP. One of the advantages of AutoLISP is that its source code can be examined in the product itself. In addition, it can be debugged during the development process. Autodesk has provided documentation, support and training materials on the Autodesk web site. ManageProject ManageProject is a macro management product that allows users to manage multiple macros in the application. For example, a user may create a macro that is unique to a project, e.g. a line that allows drawing of walls. The macro can then be used in any other drawing associated with the project. To date, Autodesk has offered only a standalone version of ManageProject. Visual LISP Visual LISP is another programming

language used by developers to create customizations to the product. For example, a programmer could use Visual LISP to create the functionality needed for a graphical user interface (GUI). See also Comparison of CAD editors for CAE List of CAE ff5e5ca8c9

Q: JSON.parse() not working I'm sending a json via AJAX request to the server and my server is returning the JSON fine. In my jQuery I'm attempting to parse it like so: var ajaxParse = JSON.parse(responseText); This is not working. The responseText (and responseJSON) is always undefined, despite the fact that it's returning the JSON I want. What am I missing? Thanks! A: I found a solution to my problem, but it was a really weird and ugly hack. In the Ajax request I did this: var data = JSON.stringify(data); The reason this is happening is that the JSON.stringify() method returns a string object, but when using JSON.parse() you need to specify what kind of string you want to parse. var data = JSON.parse('var data = "' + data + '"'); I am not exactly sure why this works, but it's what I did. After this hack I was able to access my JSON data as expected. Q: Trying to find a better way of doing this? This is basically what I am trying to do but without the UI Lets say I

have a list of fruit that I want to put together into a bundle. I start out with one piece of fruit and add it to a list. I can then add an apples count to my value and list to see how many apples I have. So this works if I have one apple but I would like to be able to add as many fruits as I want and still have this same process. I was thinking of doing something like this but I would need to append a counter to every item so it looks like this. applesList = [{ "value": 0, "list": [] }] So this would look like this. applesList = [{ "value": 0, "list": [] },
