Q: Dynamic image sizes in IntelliJ IDEA

When working on a project, I often have to resize the images on the page to a specific size. However, if I am creating new projects, sometimes I simply forget to do this step. Is there a way to set the image dimensions in IDEA to a dynamic value that will set the dimension based on the current size of the webpage?

A: Click on the Image Editor tool window (right-click on a library resource in Project view and select "Image Editor"). You can also select the image file in the Project view and press Ctrl+Shift+I.

A: If you're using Resolver right click on any image that you want to set the width/height, select add -> media resolver -> from image file and use the file type selected and enter a name for the media resolver and press OK then just drag and drop the resolver on the Images tab and you should see the media resolver try to determine the new dimensions for the image

Note: this requires access to your project's source code, but you should already be able to do this anyway
