Take a quick look at the examples below. You'll notice that Elements 20 includes such tools as adjustments, filters, correcting and retouching, color replacement, gradients, merges and so on. Adobe says that these tools are included to enhance the user's experience. It's also much easier to create new projects, as they're no longer showing up mixed together in a single tab. Elements 20 also now includes a new tab for creating a slideshow, which is meant to enhance the user's experience. Also included are a few new tools, such as grouping and frame. But Elements also has a feature that many other desktop photography tools include, allowing you to include your presets with your photo in an album. This will allow you to add a selection of effects to a photo in less than a second. (Presets apply every time you edit the photo, so this is a great feature for batch editing projects.) A crop edit tool is also useful for scaling a photo without losing any of the important information within it, and Elements 20's new camera features make it easy to enhance photos manually. The new version of Elements also includes a new crop toolbar, which makes it easy to crop out unwanted portions of a photo, like the edges of a subject, which is what I use it for most often. This crop tool also makes creating a frame, while convenient, is quite a bit harder than the Elements versions of the past. Buttons are included for creating frames for a group of images, and I found that they work quite well, in most cases.

Go to your apps > Adobe Photoshop > go to the drop down menu and click **Downloads**, or you can head to Adobe Photoshop downloads to download the entire Creative Cloud version of Photoshop. The first step when creating an image is to open your image/photo or whatever you want to call it. Once you open your image you should see a nice image when you open the image in Photoshop. Now that you have opened it you can look at the files that make up the image. The image is made up of layers. The top layer is the background so if you click the top layer there is no content on the background. The second layer is the canvas which is the bottom layer and the actual image. This is where your content is displayed. Generally you would want to make the canvas the size of the image. This way when you resize the image your content will resize. 933d7f57e6
